

Reproducibility and stability are controlled at the pipeline level

ARG-Test verifies a deterministic local chain, exposes residual live-endpoint variance honestly, and closes archival reproducibility with offline replay.

Deterministic repository chain

Status: Verified

Mock 3-seed repeatability: 16/16
stable with zero score and coverage drift.

Seeded live experiments

Status: Supported

Live reruns remain usable for analysis, but the upstream endpoint still contributes residual nondeterminism.

Submission replay path

Status: Solved

Frozen raw generations rebuild archived result bundles offline, which is the recommended final-package reproducibility route.

Stable-case ratio across repeatability studies

Mock 3-seed 16/16 | 100%

Live multi-seed 1/5 | 20%

Live same-seed 0/3 | 0%

Observed live-endpoint variance

Live multi-seed score drift 0.12

Live multi-seed coverage drift 0.09

Live same-seed score drift 0.10

Live same-seed coverage drift 0.22
